

# 08 – Dust Properties of Galaxies from the DustPedia Sample

---

## Participants:

- **Jakob den Brok**
- Wilfried Mercier
- **Amy Ralston**
- Dr. Rosemary Coogan
- Soboh Al-Qeeq
- Sabrina Mordini
- Daysi Quinatoa
- Dr. Petia Yanchulova

## Supervisors:

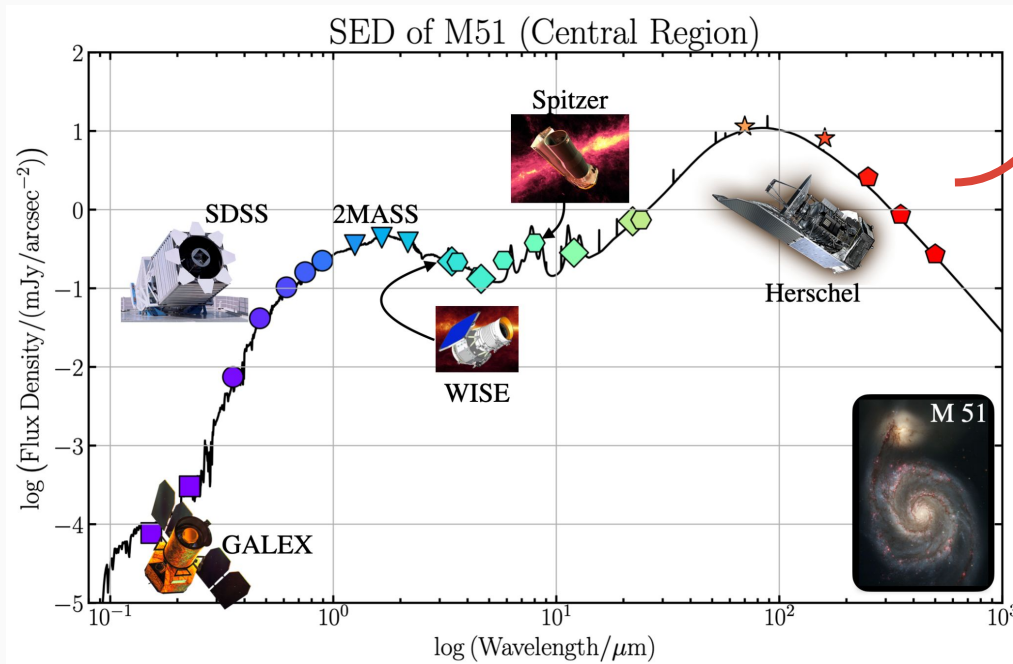

Frédéric Galliano and Angelos Nersesian

# Introduction

DustPedia  
*The Archive*

<http://dustpedia.astro.noa.gr/>

$M_{\text{dust}}$

$\Sigma_{\text{SRF}}$

$q_{\text{hac}}$

## Objectives and Goals:

- Homogenize a heterogeneous, multi-wavelength dataset (from DustPedia)
- Perform basic SED fitting with CIGALE
- What can we infer from the resulting SED fit in terms of ISM and galactic properties?

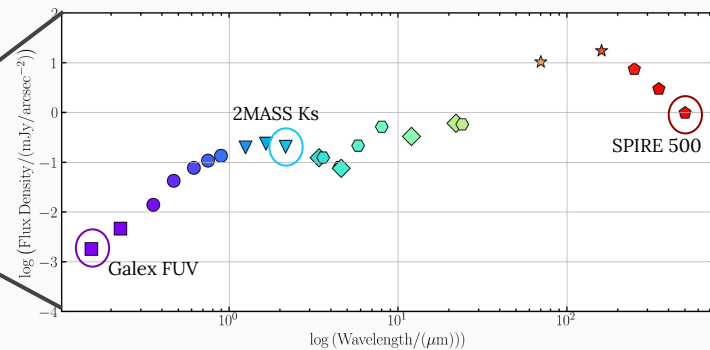

# Data Preparation: Homogenize the Dataset

Example M51:  
→ 24 observations from FUV to IR

- Remove Background Emission
- Mask Foreground Stars
- Convolve to same Resolution
- Regrid onto same Rectangular Lattice

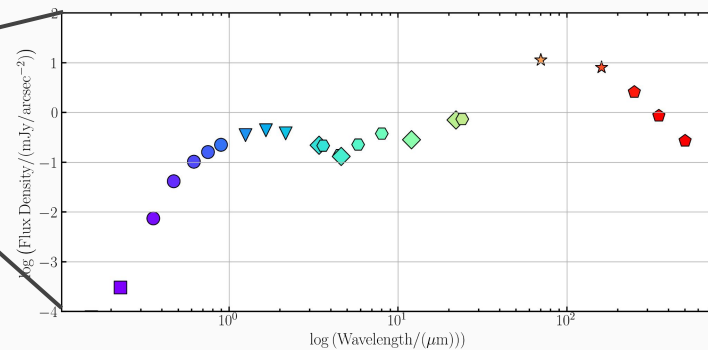

# Data Preparation: Homogenize the Dataset

Example M51:  
→ 24 observations from FUV to IR

- Remove Background Emission
- Mask Foreground Stars
- Convolve to same Resolution
- Regrid onto same Rectangular Lattice

# Data Preparation: Homogenize the Dataset

Example M51:  
→ 24 observations from FUV to IR

- Remove Background Emission
- Mask Foreground Stars
- Convolve to same Resolution
- Regrid onto same Rectangular Lattice

## Data Preparation Pipeline:

→ Pipeline for preparation of the data available on GitHub:

**pcigale-filters list** to show available filter names

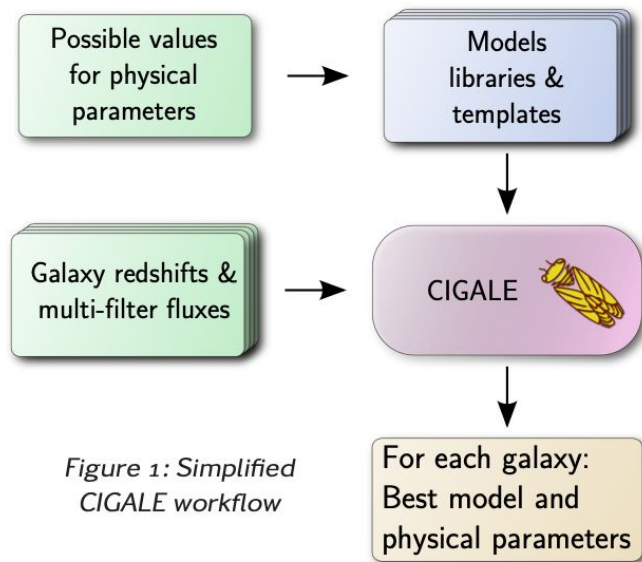

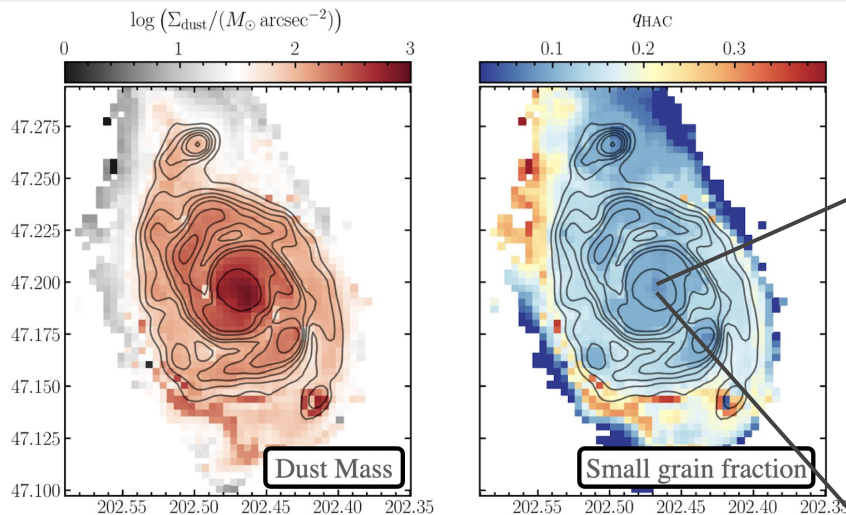

Figure 1: Simplified CIGALE workflow

## Main commands:

1. **pcigale init** : generate an init file
  - Fill it in by hand, provide modules, flux file, etc.
2. **pcigale genconf** : transform the init file into a CIGALE conf file
  - Provide grid values for each module
3. **pcigale check** : checks validity of conf file, prints number of models
4. **pcigale run** : launches cigale (~100-300 models/s/thread)

# Results

## Central Region of M51

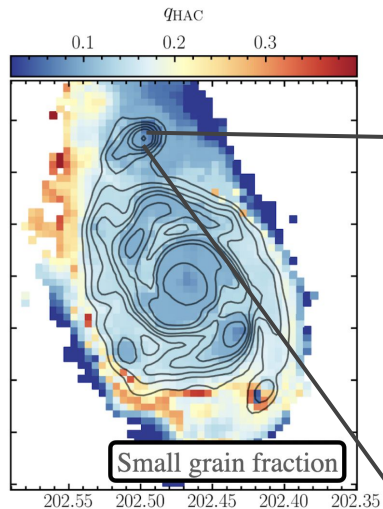

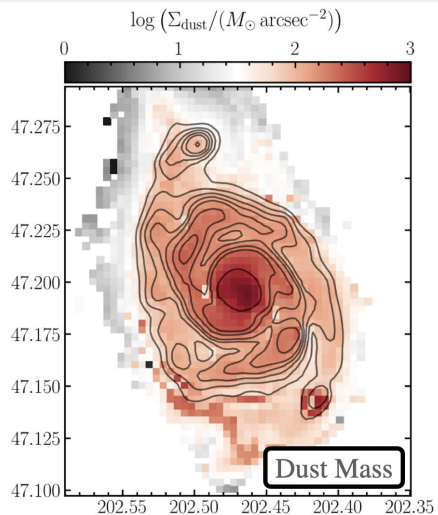

Best model for 1574.0  
( $z=0.00155$ , reduced  $\chi^2=2.7$ )

### Result:

- Get SED fit for every single pixel
- Can study spatial variation of dust properties across the galaxy.

# Results

## Central Region of Companion

Best model for 2569.0  
( $z=0.00155$ , reduced  $\chi^2=1.3e+01$ )

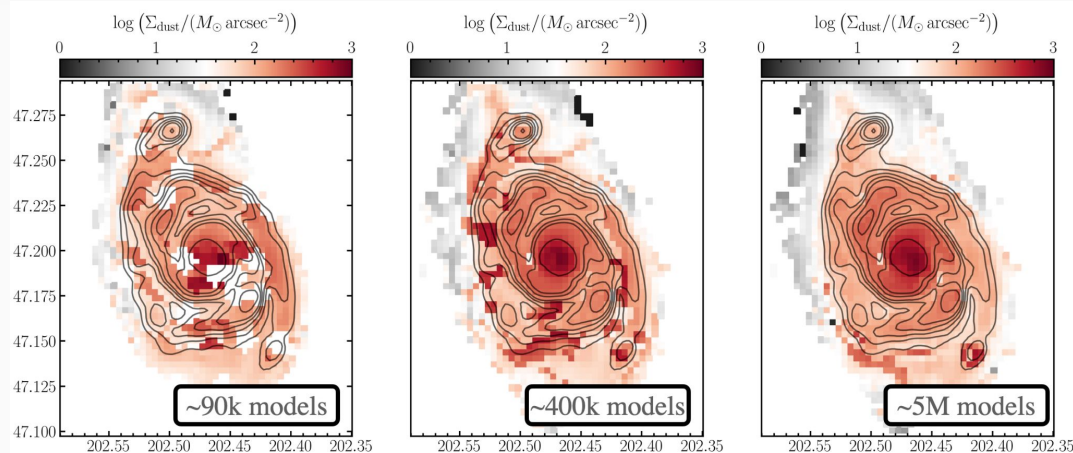

### Result:

- Get SED fit for every single pixel
- Can study spatial variation of dust properties across the galaxy.

# Results: Impact of Model Resolution and Model Selection

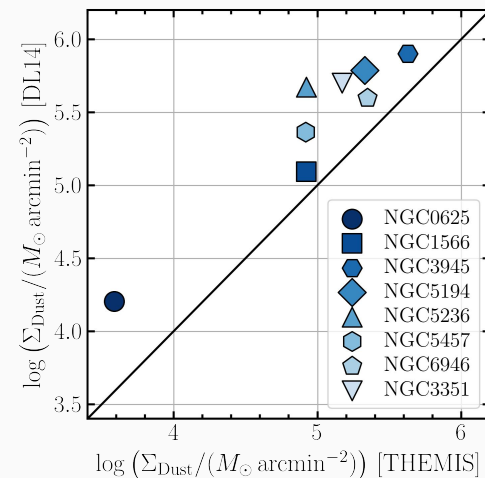

Different Model Resolution:  
→ Increasing the number of SED models fitted has an effect on the resulting inferred galactic properties

Dust Model Selection:

→ Choice of dust model affects the resulting inferred galactic properties

# Summary

## 1) Process Data

## 2) Combine Dataset

## 3) Run Cigale

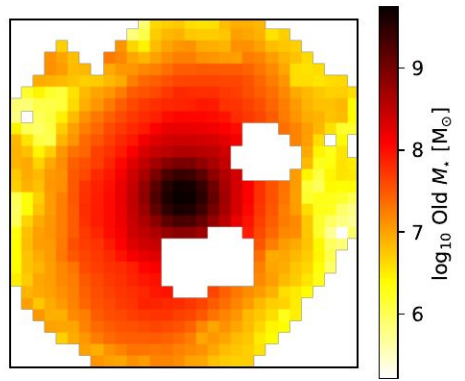

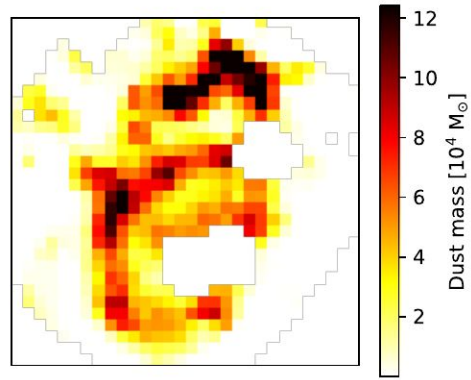

## Result: SED fit and inferred values

- Pipeline for Data-processing provided on GitHub: [https://github.com/jdenbrok/DustP\\_Data\\_Prep](https://github.com/jdenbrok/DustP_Data_Prep) 
- By fitting individual pixel → Can study spatial variation of galactic properties.
- Model selection and the resolution of the model can have non-trivial impact on the inferred quantities.
